Project Brief: Something's Fishy

Something's Fishy is going to be a website that provides tips on fish tank maintenance and automation using the Raspberry Pi mini-computer. This is a personal project of mine that I am hoping to have up and running sometime this summer. I want to create a fish tank that uses biological filtration, has a ip camera that I can view my fish with, and has a automated feeder. On my website I will provide instructions and pictures on how to build this project. My goal is to be able to view and control my fish tank's components over the internet. This website would be tailored to people within the maker community and inspire those who haven't done a DIY tech project.
